This material is intended for use by Investment Advisors, including with their clients.

Risk/Reward Analysis results are calculated based on Class T fund unit's daily data since inception. Due to the fund's limited history, all risk/reward analysis results may not be statistically relevant. Beta measures the fund's volatility relative to its benchmark: a rating of "1" implies the fund's movements are identical to the index (typically you pay a manager to achieve beta of less than 1). Up/Downside Capture is a measure of an investment manager's performance during only the up or down movements of an index (ideally you want low downside and a fairly high level of upside): the numbers shown here are the fund's up/down capture relative to the benchmark(s). **Maximum drawdown** measures the largest single drop in a class's Net Asset Value Per Unit from peak to trough before establishing a higher peak (the smaller, the better). **Holdings by Active Long Weight** is a measure of a stock's contribution to the Fund's active long performance. **Duration To Worst** is the weighted average modified duration of bonds in portfolio.

The compounded rate of return in "Growth of \$10,000 Investment" chart is used only to illustrate the effects of the compound growth rate and is not intended to reflect future values of the investment fund or returns on investment in the investment fund. Commissions, trailing commissions, management fees, performance fees and expenses all may be associated with mutual fund investments. Please read the prospectus before investing. The indicated rates of return are the historical annual compounded total returns including changes in unit value and reinvestment of all distributions and do not take into account sales, redemption, distribution or optional charges or income taxes payable by any unitholder that would have reduced returns. Mutual funds are not guaranteed, their values change frequently and past performance may not be repeated.
